

Fine Environmental Services,

sharing the Seal Sands site with sister company Fine Organics, operates a newly re-commissioned thermal oxidiser. The plant is equipped, and licensed, to treat a wide range of organic and aqueous liquid process effluents and process off-gasses by exposing them to high temperature (up to 1150°C) in the presence of an excess of oxygen.

The oxidised materials exiting the furnace are then cleaned using a range of absorption and particulate removal equipment to meet the most recent regulatory standards for emissions to atmosphere and water.

With a consented waste throughput of 50,000 tpa, the thermal oxidiser is capable of meeting the effluent treatment requirements of Fine Organics with some capacity made available to treat streams produced on third party sites.

The unit is capable of accepting effluent directly from IBCs as well as from bulk tanker.
